Вітаю!

Hello!

Mike Kidik

Product Officer

A Look at API 2.0

Why change the existing API?

- Outdated naming
- Complex data structures
- Insufficient performance

Key features

Improved naming

Up-to-date industry-standard names for objects and their parameters

Fields cherry-picking

Specify what parameters you want to get in the API response

Connected objects

Use a single API call to get the object of interest and any other connected objects

What's in it for CSPs?

Leveraging the shiny new API 2.0

Higher application performance due to handling only required data and fewer API calls

Simpler troubleshooting with clearer and more detailed error messages

Shorter development timelines due to a streamlined development process and easier learning

Stress-free migration through the gradual API 2.0 rollout

Дякую!

Thank
you!

Mike Kidik
